title: Deployment Guide

version: 1.0

module: deployment

last_updated: 2026-09-06

Deployment Overview (#deployment-overview)

The AskMyDocs platform has a guaranteed uptime SLA of 99.95% for the Enterprise plan.

The standard topology deploys the API service, the ingestion worker, and the Identity Service. The ingestion worker processes documents asynchronously from a queue.

Environments (#environments)

The platform supports three deployment environments.

Warning: Do not use production credentials in development or staging.

Database Migrations (#database-migrations)

Schema changes are applied through versioned migrations. Migrations run automatically at deploy time before new code is released.

Downgrades are not supported automatically. Always back up before deploying a migration.
